

Highlights: Tire Stores

Selecting the right tire dealer could spare significant wear-and-tear on your wallet, to the tune of hundreds of dollars. What's more, having the right tires for your vehicle, maintaining them properly, and replacing them when they go bad will make driving safer (and likely more pleasant), and cut your fuel costs. ***Twin Cities Consumers' Checkbook*** (available at www.checkbook.org) priced specific tires at tire dealers in the Twin Cities area and online. Some highlights from Checkbook's report:

- Checkbook found major price differences among local tires stores and online retailers. For example, prices for a set of four Bridgestone Dueler H/L 400 tires for the Ford Explorer ranged from \$704 at Capital Tire in Shakopee and \$710 at Walmart to \$1,107 at NTB—a difference of \$403.
- Among local stores, chains Walmart, Discount Tire, and Costco offered low overall prices, but Checkbook's shoppers also found low prices at some independent tire dealers, repair shops, and even new-car dealerships. The lowest prices were quoted by Capital Tire, American Tire & Auto in Brooklyn Center, and the Goodyear Auto Service Center on Silver Lake Road in Minneapolis.
- Not all of the big chains or big-box stores offered low prices. Surveyed stores for Firestone Complete Auto Care, NTB, Pep Boys, Sam's Club, Sears, and Tires Plus quoted prices that ranged from slightly below average to higher than average.
- Although Costco and Walmart offered low prices, a big advantage to using a conventional tire shop is that selection at the big-box discounters is fairly limited.
- Online sellers Amazon and OnlineTires.com also offered consistently low prices—with incomparable selection. These retailers will ship tires to your home or to a local shop for installation. (Checkbook factored in an average installation fee of \$90 to online sellers' prices.) Among online sellers, Amazon's prices were the lowest—about four percent lower than prices offered by OnlineTires.com and six percent lower than TireRack.com's.
- Stores that had low prices for one tire model tended to be competitive for others, but you can't count on that. Some stores quoted low prices for one tire model but average or higher-than-average prices for others.
- When shopping for price, specify exactly what you want. If you want mounting, balancing, and valve stems to be included, make that clear. And because there are so many tire models, many with very similar names and specifications, cite the tire model precisely, preferably by the parts number.
- Stores tend to specialize in certain brands, order some upon request, and refuse to handle others. They are likely to offer their best prices for their specialties. Indeed, some of the stores we shopped would probably have looked better if Checkbook had shopped for other brands.
- While shopping for tires, you may be offered road-hazard coverage. Some stores, including Costco and Sam's Club, provide this type of coverage for free, but many charge an extra \$40 to \$75 to cover a set of four tires.
 - The protection covers tire damage due to road hazards during normal driving. In other words, if you get a flat from a nail or other road debris, the company promises to repair or, if necessary, replace the tire. But if you get a flat from running over a curb or because of other driver errors, you get nothing. And plans never pay for failure from worn tread.
 - Unless they're free, these plans aren't good deals. First, consider that if a nail flattens your tire, a shop will charge only \$20 or so to plug and repair it. Just as you can't predict when or where you'll have a flat, you can't predict which tire will get one, so you'll have to buy the plan for all four. So you're paying \$60 or so to protect yourself against having to pay \$20 or

so for each tire repair you may never need. Second, flat tires due to nails and other debris are relatively unlikely.

- As with any type of “protection plan” pushed by big-ticket sellers, what you’re really being offered is insurance that is highly profitable for the seller but provides little benefit to the buyer.
- If the roadside assistance element of one of these plans is of value to you, consider joining AAA, which offers various membership benefits in addition to roadside help.

Whichever tires you buy, a key to getting the most possible value from them is to maintain them properly. Here are some guidelines:

- Be sure to have your tires balanced when you buy them (most dealers will balance for free). Then have them re-balanced if you experience vibration or uneven tread wear.
- Keep tires properly inflated.
- Rotation generally isn’t worth paying for. Regular tire rotation will extend the tread life of a set of four by allowing even wear. But the gain in tread life will probably not offset the cost of having the tires rotated, unless your shop rotates them for free.
- Misalignment of wheels can result from a bad jolt such as hitting a pothole. It can cause your steering system to pull to one side or the other and can cause uneven tire wear. If you observe such problems, be sure to have the alignment checked.
- You need to replace your tires when they wear down to 1/16-inch of tread. You will know your tires have reached this level when the tire tread is even with the wear bars that are built into the tread. You can also measure the tread with a penny: insert the penny Lincoln-head first in a tread groove; if the treads don’t cover part of the head, they are worn too far down.
- Even if you don’t drive much, your tires will still suffer the drying effects of aging, reducing their performance and safety, possibly even before the tread is worn down. A number of auto manufacturers recommend that tires be replaced after six years, regardless of tread wear.
- Regardless of tread wear or age, you will want to replace a tire if you see a bulge or blister on the sidewall, and you will want an expert inspection of the tires if you see cuts or cracking.
